Relativity®
Assisted Review

Relativity is the e-discovery software that amplifies the efforts of your case team through computer-assisted review and statistical validation.

Overview

Relativity Assisted Review is the flexible and transparent computer-assisted review workflow that combines process and technology. Review teams begin by subjectively coding a sample set of documents. Based on those expert decisions, Relativity categorizes the rest of the documents in a case. You then validate Relativity's decisions by manually reviewing statistically relevant subsets of documents to ensure coding accuracy. Because batches of documents categorized by Relativity are validated using statistics, you can be confident in your results.

Iterative Process

By manually reviewing statistically relevant subsets of documents coded by the computer, you can ensure accuracy and validate your results. Reviewers will either agree with how Relativity has categorized a document, or disagree and overturn the decision. This allows you to train the system, so Relativity will get smarter and make better decisions as your review team continues to code. Once your team starts consistently agreeing with how Relativity is categorizing documents, you can move to the next phase of your project.

Reporting

Using reports, you can gauge your progress and gain transparency into why Relativity categorized documents the way it did. An overturn report shows how many of Relativity's decisions were reversed by your review team and the documents that led the system to make those decisions. You can drill into these documents for more detail, and easily batch them out for further review. You can also compare your responsiveness designation and issue coding to hone in on documents that may be problematic, such as documents with a high number of issues that are coded as non-responsive.

How can Assisted Review fit my unique workflow?

You can run multiple Assisted Review projects within a single case and begin projects at any time during review. Reports provide you with complete visibility throughout the life of your project, showing you the decisions being made by the review team and Relativity, as well as how they relate to one another. This combination of flexibility and transparency allows you to be nimble, spending less time and money wading through volumes of data.

Relativity Assisted Review has been placed on The Recorder's list of The Best Predictive Coding Solution Providers of 2012.
