

# Structured Data Reader™

Efficiency. Cost savings. Simplified data.

## Data Processing that saves you significant time and money.

Legility Structured Data Reader (SDR) produces distinct, readable, user-friendly output from chat transcripts allowing efficient, rapid review of messaging platform data like Bloomberg chat terminals, Skype, Facebook Messaging, Google's Gchat, Microsoft Teams, and many more.

### Overview

Structured Data Reader processes all document formats and data across numerous servers and outputs everything in a reviewable HTML file with Date, Subject and Recipients in the same location. SDR uses alternating line styles to visually highlight the individual chats within a conversation thread, allowing reviewers to locate information more quickly by simplifying the output and streamlining the process.

### Features

- **Parallel Processing Platform:** Allows for task execution to be spread across as many servers as required
- **Source Formats:** Can process approximately 30 formats including: CSV, DAT, XML, JSON, MySQL, HTML Tables and SMS
- **Binary Attachments:** When SDR is presented with data that refers to attachments (such as Microsoft Office documents) it manages text extraction on those files

### Structured Data Reader Offers

Streamlined processing across all document, data and server formats

Simplified output of all data into one reviewable HTML file

## Structured Data Reader Benefits

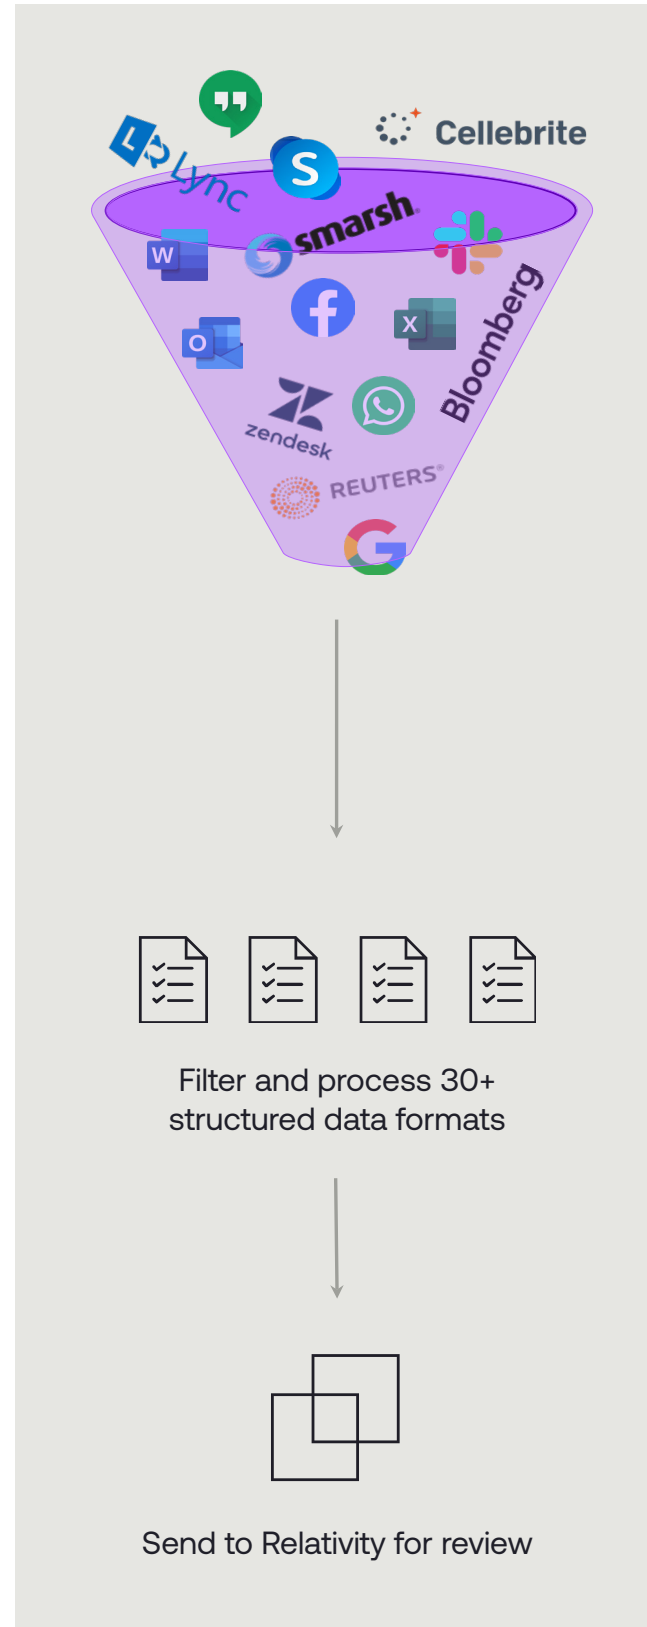

- Reduce setup time and project overhead significantly
- Free up project managers and other costly resources to work on bigger jobs
- Streamline eDiscovery processes and reduce time-to-production
- Quick access to data from anywhere
